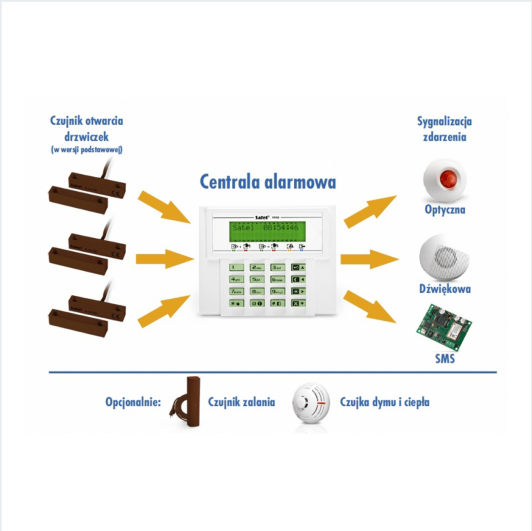
SECURITY AGAINST DEWASTATION AND THEFT



In public facilities, sometimes there is devastation, theft. Valves and their covers are stolen from the cabinets for hydrant valves, the locks are torn out. Fire hoses, nozzles, fire fighting fittings disappear from hydrant cabinets. All these activities make the equipment that must be 100% operational, unusable. In addition, thefts and devastations are an additional burden on the budgets of the owners and users of the facilities.

To avoid such events, we have prepared monitoring systems for wardrobes and hydrants, which we offer together with professional assembly.

System description:

The system consists of sensors, signaling devices and a control unit (alarm control panel with keypad / keypads).

The centrals offered by us thanks to their versatility and a wide range of available accessories allow to configure the system according to the needs of users, and a well-thought-out user interface ensures easy and intuitive system operation. The control panels can be programmed via the built-in keypad and LCD screen or using a computer operating in Windows systems. The system can be easily expanded, changed or adapted to needs.

The system can be operated using:

- LCD / LED keypads,
- card readers,
- remote controls

Transmission of information about the alarm takes place using the built-in telephone communicator, GSM / GPRS modules and TCP / IP.
